# Abstract

Delivering quality software to customer is the key objective of software industry. One of the essential fragment of life cycle of software is software testing. In software testing test automation is playing a major role. Test automation is an art which needs to be managed and executed properly in order to provide quality software. If test automation cannot be practiced in proper way the delivery of the software quality would impact directly and leads to loss of customer, which is a failure of business. Test automation contain several phases from scoping to maintenance. Each phase has several steps which require right analyzing, decision making and operating.

Test automation has several problems which needs to address in each stage. Test automation cause several issues when execute test automation in a company. All these issues need to be handled by different people, therefore initially issues need to be identified and classified and then solve properly.

This research is to identify the improvements to categorize the problems automatically and find the solution for the problem in test automation process and hence to practice the test automation in healthier way in order to achieve better software quality. Test automation issue are analyzed and the solutions are proposed. On which stage, the test automation is causing problems and how to solve them are recommend in this research, Test automation issues are categorized and under relevant category therefore issues can be solved speedily.

The automation cause huge amount of issues. Test automation is running over nigh in most of the companies and it result lots of issues. These issues can't be analyzed one by one and allocated to relevant people. The implementation of this research will categorize the issues under relevant category and which would lead for speedy allocation under relevant person and solution. This research produced a system to categorize the test automation problems in automatic way using text classification approach. The issues are passed as sentence and they are categorized under the relevant category to fix them quickly. The sentences are preprocessed and conducted feature selection using filter methods and predict under appropriate category. The issue has been cleaned in preprocess stage. Implemented LSTM base algorithm using filter method to categorize the issues.

Find the solution for the problem in test automation process and how to practice the test automation in healthier and proper way in order to achieve better software quality. In this research an implementation to categorize test automation problems were formed. Recommendation and solutions are proposed on test automation which would aid to practice test automation in better way and that would leads to better software quality delivery.

# **Acknowledgment**

I would like to thank Mr. U. U. Samantha Rajapaksha of Sri Lanka Institute of Information Technology for the guidance and the extended support provide for this research. I also want to thank to each and every one who participate in the review and survey.
